LCM and GCD via factorization Lecture 5a: 2022-02-07

MAT A02 – Winter 2022 – UTSC Prof. Yun William Yu

Greatest common divisor

- Suppose *d* divides *n*. Then prime factorization of *d* must have exponents less than or equal to prime factorization of *n*.
- If d divides both n and m, then all of the exponents must be less than or equal to those in both n and m.
- The greatest common divisor thus has exponents exactly equal to the smaller of the exponents in n and m.
 54 = 24 + 2 + 6

 $24 = 2^{3} \cdot 3$ $24 = 6 \cdot 4$ $3 = 2 \cdot 3^{3}$ $3 = 2 \cdot 3^{3} = 2^{3} \cdot 3^{3} = 6$ $24 = 2 \cdot 3^{3} = 6$

Least common multiple

- Suppose *m* is a multiple of *a*. Then prime factorization of *m* must have exponents greater than or equal to prime factorization of *a*.
- If *m* is a multiple of both *a* and *b*, then all of the exponents must be greater than or equal to those in both *a* and *b*.
- The least common multiple thus has exponents exactly equal to the larger of the exponents in *n* and *m*.

 $24 = 2^{3} \cdot 3$ 24, 48, 72, 76, 120, 1445 168, 192, 2/6 $54 = 2 \cdot 3^{3}$ 168, 192, 2/6 $54 = 2^{3} \cdot 3^{3} \quad 54, 108, 162, 2/6$ $= 8 \cdot 27 = 2/6$

$\operatorname{lcm}(a,b) \cdot \operatorname{gcd}(a,b) = ab$

• The lcm gets all the smaller exponents, and the gcd gets all the larger exponents, so multiplied together, you get all of the original exponents in *a* and *b*.

$$a = 2^{c_{2}} 3^{c_{3}} 5^{c_{5}} 7^{c_{4}} 11^{c_{11}} \cdots$$
