# Systems of Linear ODEs Lecture 10a: 2023-03-20

MAT A35 – Winter 2023 – UTSC Prof. Yun William Yu

## System of two first-order ODEs

- Let t be the independent time variable, and let x and y be two dependent variables.
- If *a*, *b*, *c*, *d* are constants, then  $\begin{cases}
  \frac{dx}{dt} = ax + by \\
  \frac{dy}{dt} = cx + dy
  \end{cases}$

is a homogeneous system of two first-order linear ODEs.

• Similarly, 
$$\begin{cases} \frac{dx}{dt} = ax + by + f(t) \\ \frac{dy}{dt} = cx + dy + g(t) \end{cases}$$

is an inhomogeneous system of two firstorder linear ODEs.

## Reduction method

- We can solve a system of two first-order linear ODEs by converting it into a single second-order linear ODE.
  - First compute  $\ddot{x}$  as a function of  $x, y, \dot{y}$  from the first equation.
  - Then eliminate y by substituting in the second equation.
  - Then, eliminate y by substituting in the first equation.

## Solve 2<sup>nd</sup>-order ODE

- Find eigenvalues/roots of the characteristic equation.
- Solve for *x*.
- Solve for y.

### Initial values

• If there are initial values, plug them in.

#### Try it out

• 
$$\begin{cases} \dot{x} = y \\ \dot{y} = -x + 2y' \end{cases} x(0) = 1, y(0) = 3$$

• Step 1: Find  $\ddot{x}$ .

• Step 2: Get rid of  $\dot{y}$ .

A: 
$$\ddot{x} = 0$$
  
B:  $\ddot{x} = 1$   
C:  $\ddot{x} = y$   
D:  $\ddot{x} = \dot{y}$   
E: None of the above

A: 
$$\ddot{x} = y$$
  
B:  $\ddot{x} = -x + 2y$   
C:  $\ddot{x} = -xy + 2y^2$   
D:  $\ddot{x} = \dot{y}$   
E: None of the above

• Step 3: Get rid of y and rewrite.

A: 
$$\ddot{x} + 2\dot{x} + x = 0$$
  
B:  $\ddot{x} - 2\dot{x} + x = 0$   
C:  $\ddot{x} + 2\dot{x} - x = 0$   
D:  $\ddot{x} - 2\dot{x} - x = 0$   
E: None of the above

#### Try it out (continued)

• Step 4: Solve the ODE

A: 
$$x = c_1 e^t + c_2 e^{-t}$$
  
B:  $x = c_1 e^t + c_2 e^{2t}$   
C:  $x = c_1 e^t + c_2 x e^t$   
D:  $x = c_1 e^t + c_2 t e^t$   
E: None of the above

• Step 5: Plug back in to solve for y.

A: 
$$y = c_1 e^t + c_2 t e^t$$
  
B:  $y = (c_1 + c_2) e^t + c_2 t e^t$   
C:  $y = c_1 e^t + (c_1 + c_2) t e^t$   
D:  $y = (c_1 + c_2) e^t + (c_2 - c_2) t e^t$   
E: None of the above

#### Try it out (continued)

• Plug in initial values x(0) = 1, y(0) = 3

A: 
$$c_1 = 1, c_2 = 1$$
  
B:  $c_1 = 1, c_2 = 2$   
C:  $c_1 = 2, c_2 = 1$   
D:  $c_1 = 2, c_2 = 2$   
E: None of the above

## Inhomogeneous example

• 
$$\begin{cases} \dot{x} = x + y + 9t \\ \dot{y} = 4x + y + 3 \end{cases}$$

#### Example (continued)

•  $\ddot{x} - 2\dot{x} - 3x = -9t + 12$ 

## Solve for *y*

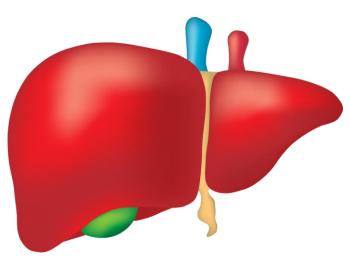

$$\begin{cases} \dot{x} = x + y + 9t \\ \dot{y} = 4x + y + 3 \end{cases}$$

•  $x = c_1 e^{-t} + c_2 e^{3t} + 3t - 6$ 

## Application (Bittinger, 9.3, Ex. 5)

 3mg of glactosyl human serum albumin (Tc-GSA) is injected into a patient's bloodstream to measure liver function. After injection, Tc-GSA is transferred from the blood to the liver at 6% per minute, and from the liver into blood at 3% per minute.

 How much Tc-GSA is in the blood or liver as a function of time?

## Application (continued)

$$\begin{cases} \dot{B} = -0.06B + 0.03L \\ \dot{L} = 0.06B - 0.03L \end{cases}$$

#### Application (continued)

•  $\ddot{B} + 0.09\dot{B} = 0$   $L = \frac{100}{3}\dot{B} + 2B$ 

#### Initial Value Problem

•  $\begin{cases} B(t) = c_1 + c_2 e^{-0.09t} \\ L(t) = 2c_1 - c_2 e^{-0.09t}, \text{ with initial values} \begin{cases} B(0) = 3 \\ L(0) = 0 \end{cases}$
